Team ID	PNT2022TMIDxxxxxx
Project Name	Car Rental Request in ServiceNow
Technology	ServiceNow – Service Catalog and Workflows
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit identifies the practical problem faced by target users and checks whether the proposed solution addresses it. This project focuses on making car rental requests standardized, trackable and automated through ServiceNow Service Catalog and workflows.

Purpose:

- Solve the difficulty of handling car rental requests through a structured ServiceNow process.
- Reduce manual coordination using a standard Service Catalog request form.
- Improve request handling through availability checking and manager approval.
- Provide clear request status and centralized records.
- Handle unavailable-car cases through the configured exception/incident process.

Problem – Solution Fit Canvas

1. CUSTOMER SEGMENT(S) Employees/requesters needing a vehicle; managers reviewing requests; Car Rental/Fleet team handling fulfillment.	6. CUSTOMER CONSTRAINTS Limited visibility of vehicle availability; manual coordination may delay confirmation; approval is required; incomplete details can cause delays.	5. AVAILABLE SOLUTIONS Manual request/communication processes; ServiceNow Service Catalog provides a standardized request channel; workflows provide structured processing.
2. JOBS-TO-BE-DONE / PROBLEMS Submit rental details; know whether a suitable car is available; obtain manager approval; track the request until completion.	9. PROBLEM ROOT CAUSE Requests may lack one standardized process. Availability and approval can require manual coordination. Status and exception handling may not be centralized.	7. BEHAVIOR User submits request; manager reviews; fulfillment team acts on approved requests; unavailable vehicles require exception handling.
3. TRIGGERS Need for a vehicle; user opens the Car Rental Request catalog item; request is submitted into the configured workflow.	10. OUR SOLUTION ServiceNow Car Rental Request using Service Catalog and workflows. Collect car type, pickup/drop location, requested date and justification; check availability; route for approval; support fulfillment and unavailable-car handling.	8. CHANNELS OF BEHAVIOR ServiceNow Service Catalog/Service Portal; request and approval records; Workflow/Flow Designer; notifications where configured.
4. EMOTIONS: BEFORE / AFTER Before: uncertainty about status, availability and approval. After: structured request path with visible workflow stages and centralized records.	RESULT / FIT The solution maps request, availability, approval and tracking needs to ServiceNow capabilities, providing a standardized process.	SUCCESS INDICATORS Request submitted; availability evaluated; approval routed; outcome/status recorded; unavailable-car exception handled as configured.

Project-Specific Problem Statement

Car rental requests can involve capturing trip details, checking vehicle availability, obtaining approval and assigning a vehicle. Without a standardized workflow, these activities can require repeated manual coordination and make tracking difficult.

Project-Specific Solution Statement

The Car Rental Request system uses ServiceNow Service Catalog to collect standardized information and workflows/Flow Designer to automate processing. The configured flow evaluates availability, routes the request for manager approval, and supports fulfillment and exception handling. A Business Rule can prevent assignment when a car is not available, while the configured unavailable-car path can create an incident.
