Functional Specification Document

Project Title	Car Rental Request System in ServiceNow
Platform	ServiceNow – Service Catalog and Workflows
Team ID	PNT2022TMIDxxxxxx
Version	1.0
Date	14 September 2026

1. Introduction

- Project Title: Car Rental Request System in ServiceNow
- Team Members: Project team members and their roles to be entered by the team.

This project provides a centralized ServiceNow solution for submitting and processing car rental requests through a Service Catalog item and configured workflow/Flow Designer automation.

2. Project Overview

• Purpose:

The purpose is to simplify the car-rental request process, reduce manual coordination, provide a structured approval process, and maintain request status within ServiceNow.

• Features:

- Service Catalog item for submitting a Car Rental Request.
- Catalog variables for car type, location and required trip/request information.
- Automated workflow/Flow Designer processing.
- Manager approval and rejection handling.
- Car-availability condition and exception handling.
- Incident creation for the configured unavailable-car scenario.
- Request status tracking and notifications where configured.

3. Architecture

Layer	ServiceNow Architecture / Component
User Interface	Service Catalog request form used by the requester to enter and submit car-rental details.
Catalog Layer	Car Rental Request catalog item, variables and submission configuration.
Automation Layer	Workflow / Flow Designer controls request processing, conditions and routing.
Approval Layer	Manager approval/rejection task and corresponding request status update.
Exception Layer	Unavailable-car path and configured incident creation for follow-up.
Data Layer	ServiceNow request records and incident records store process information.

Process Flow

Requester → Service Catalog → Car Rental Request → Workflow / Flow Designer → Car Availability Check → Manager Approval → Approved / Rejected → Final Request Status. If the configured car-availability condition identifies an unavailable car, the exception path can create an Incident.

4. Setup Instructions

• Prerequisites:

- Access to an authorized ServiceNow development/test instance.
- Appropriate ServiceNow roles/permissions to configure Service Catalog and workflows.
- A configured user/manager relationship for approval testing.
- Required catalog variables and workflow/Flow components.

• Installation / Configuration:

1. Open the ServiceNow development instance.
2. Create or open the Car Rental Request catalog item.
3. Configure the required catalog variables such as car type, location and trip/request details.
4. Configure the workflow/Flow Designer process and its conditions.
5. Configure manager approval and rejection handling.
6. Configure the unavailable-car exception and incident creation where required.
7. Test the complete request lifecycle.

5. Configuration / Folder Structure

Unlike the MERN template, this project does not use separate client/server folders. The implementation is organized as ServiceNow application configuration:

Configuration Area	Contents
Service Catalog	Catalog item, variables and request form configuration.
Workflow / Flow Designer	Triggers, actions, conditions, approval and outcome handling.
Business Rules / Automation	Project-specific server-side logic where configured.
Tables / Records	Request-related records and Incident records.
Notifications	Configured requester/approver notifications, if enabled.
Testing Evidence	Screenshots and test results from the ServiceNow instance.

6. Running the Application

The project runs inside the configured ServiceNow instance. The requester navigates to the Service Catalog, opens the Car Rental Request item, enters the required information and submits it. The configured workflow/Flow then processes the request and routes approval and exception handling.

Step	Action
1	Log in to the authorized ServiceNow instance.
2	Navigate to Service Catalog.
3	Open the Car Rental Request catalog item.
4	Enter the required variables and submit the request.
5	Verify workflow/Flow execution and approval routing.
6	Verify final request status and incident creation when the unavailable-car condition is triggered.

7. API Documentation

No external REST API endpoints are specified in the supplied project information. The core project operates through ServiceNow Service Catalog and workflow automation. If integrations are added later, document the endpoint, HTTP method, parameters, authentication and response format here.

8. Authentication

Authentication is handled through the ServiceNow instance's configured user-access mechanism. The project uses authorized ServiceNow users and roles to access the catalog, submit requests, perform manager approval and view/process records. Specific authentication configuration is not provided in the source material and should be added from the actual ServiceNow instance if required.

9. User Interface

UI Area	Description / Evidence
Service Catalog	Car Rental Request catalog item and input variables.
Request Record	Submitted request details and current status.
Approval	Manager approval/rejection interface or task.
Incident	Incident record created for the configured unavailable-car scenario.

Screenshots from the actual ServiceNow instance should be inserted in this section. Recommended evidence: catalog item, submitted request, workflow/Flow Designer, approval task, and generated incident.

10. Testing

Test ID	Scenario	Expected Result
TC-001	Valid Car Rental Request	Request is created successfully.
TC-002	Required/invalid catalog fields	Invalid or missing values are handled correctly.
TC-003	Available car	Request follows the normal workflow path.
TC-004	Manager approval	Approved request proceeds to the configured next stage.
TC-005	Manager rejection	Rejected request receives the configured outcome.
TC-006	Unavailable car	Configured exception path is triggered.
TC-007	Incident creation	Incident is created when the configured condition is met.
TC-008	End-to-end request	Complete request lifecycle works as specified.

11. Screenshots or Demo

Add screenshots or a project-demo link from the actual ServiceNow instance. Suggested screenshots are: (1) Service Catalog Car Rental Request, (2) filled request variables, (3) submitted request, (4) workflow/Flow Designer, (5) manager approval, (6) unavailable-car result, and (7) generated Incident.

12. Known Issues

- The project depends on correct ServiceNow configuration of catalog variables and workflow conditions.
- The ServiceNow instance URL and credentials are environment-specific and are not included in this document.
- Actual test results and defect status should be updated after execution in the test instance.

13. Future Enhancements

- Integrate with a live car/fleet inventory to provide real-time availability.
- Add automatic car assignment and reservation after approval.
- Add cancellation, modification and rental-extension workflows.
- Add richer ServiceNow dashboards and analytics for request trends and utilization.
- Integrate external fleet or car-rental systems when required.
- Expand notifications and escalation rules for pending approvals.

Source-format note: The uploaded document is a MERN Project Documentation format with sections from Introduction through Future Enhancements. ■filecite■turn11file0■L2-L28■ The generated document preserves that section organization while adapting technology-specific content to the ServiceNow Car Rental Request project.
