

PROJECT REPORT

Final Report Template

Project Name	Car Rental Request System in ServiceNow
Project Type	ServiceNow Service Catalog and Workflow Automation
Team ID	PNT2022TMIDxxxxxx
Date	14 September 2026
Version	1.0

1. INTRODUCTION

1.1 Project Overview

The Car Rental Request System is a ServiceNow-based request automation project. It provides a Service Catalog item through which a user can submit a request for a rental car. The request is processed through configured workflow/Flow Designer automation, including request validation, car-availability handling and manager approval. When the requested car is unavailable, the configured process can create an incident for follow-up.

1.2 Purpose

The purpose of the project is to simplify and automate the car-rental request process in ServiceNow, reduce manual coordination, provide a structured approval process, and maintain request status and exception handling within the ServiceNow platform.

2. IDEATION PHASE

2.1 Problem Statement

Manual car-rental requests can require repeated communication between the requester, car-availability team and manager. The project addresses this by providing a centralized Service Catalog request and an automated workflow for processing the request.

2.2 Empathy Map Canvas

Says	Thinks	Does	Feels
I need a car for my trip/request.	Is the required car available? Will my manager approve it?	Submits the request and checks its status.	Wants a simple and predictable request process.

2.3 Brainstorming

Key ideas considered for the solution include a Service Catalog request form, catalog variables for rental details, automated workflow processing, manager approval, car-availability handling, request-status tracking and incident creation for the configured unavailable-car scenario.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Stage	User/System Activity
Request	User opens the Car Rental Request catalog item and enters the required details.
Submit	User submits the request and ServiceNow creates the request record.
Process	Configured workflow/Flow processes the request and evaluates the relevant conditions.
Availability	System follows the configured available/unavailable car path.
Approval	Manager reviews and approves or rejects the request.
Outcome	Request reaches its configured final status; unavailable-car handling can create an incident when applicable.

3.2 Solution Requirement

ID	Requirement	Description
FR-01	Service Catalog	Create a Car Rental Request catalog item with required variables.
FR-02	Request Submission	Allow the requester to submit the completed request and generate a request/number.
FR-03	Workflow	Automatically process the submitted request using configured workflow/Flow steps.
FR-04	Availability	Handle available and unavailable car conditions.
FR-05	Approval	Route the request for manager approval/rejection.
FR-06	Incident Handling	Create an incident for the configured unavailable-car scenario.
FR-07	Status	Allow the request status/outcome to be tracked.

3.3 Data Flow Diagram

Textual flow representation: Requester → Service Catalog → Car Rental Request Record → Workflow / Flow Designer → Car Availability Condition → Manager Approval → Approved/Rejected Outcome → Final Request Status. If the configured unavailable-car condition is met, the exception path creates an Incident for follow-up.

Requester	Service Catalog	Workflow / Flow	Approval / Outcome
Enter car rental details	Create request	Check conditions and route steps	Manager approval → final status

3.4 Technology Stack

Component	Technology / Use
Platform	ServiceNow
Request Interface	Service Catalog / Catalog Item
Automation	Workflow / Flow Designer
Approval	Manager approval process
Data / Records	ServiceNow request and incident records
Business Logic	Configured workflow conditions and project automation/business rule where applicable

4. PROJECT DESIGN

4.1 Problem Solution Fit

The proposed ServiceNow solution directly maps the user need for a simple car-rental request process to a centralized catalog form and automated workflow. The request is captured once, processed through defined conditions and approval, and tracked as a ServiceNow record.

4.2 Proposed Solution

Create a Car Rental Request catalog item with the required variables. On submission, trigger the configured workflow/Flow. The workflow handles request processing and manager approval. Car availability is evaluated according to the configured project logic. For an unavailable car, the configured exception handling can create an incident.

4.3 Solution Architecture

Layer	Project Component
User Layer	Requester submits and tracks the Car Rental Request.
Service Catalog Layer	Catalog item and variables capture car type, location and required trip/request information.
Automation Layer	Workflow / Flow Designer processes the request and routes conditions and approval.
Approval Layer	Manager reviews and approves/rejects the request.
Exception Layer	Unavailable-car condition follows the configured exception path and can create an incident.
Record Layer	ServiceNow request and incident records store the process information.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Sprint	Area	Planned Work	Story Points
Sprint-1	Service Catalog	Catalog item, variables and request submission	7
Sprint-2	Workflow & Approval	Workflow/Flow processing, availability and manager approval	9
Sprint-3	Exception & Tracking	Unavailable-car handling, incident creation, status and notifications	7
Sprint-4	Testing	End-to-end functional and performance validation	3

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Testing covers valid and invalid catalog inputs, request submission, workflow/Flow execution, manager approval and rejection, available and unavailable car scenarios, incident creation, request-status tracking, notifications where configured, and end-to-end processing. Performance checks can measure request-processing time, workflow execution time and behavior under multiple requests. Actual measured results should be entered after execution.

7. RESULTS

7.1 Output Screenshots

Screenshot ID	Recommended Evidence
SS-01	ServiceNow Service Catalog – Car Rental Request item
SS-02	Car Rental Request variables / submitted request
SS-03	Workflow / Flow Designer configuration
SS-04	Manager approval request/task
SS-05	Available/unavailable car processing result
SS-06	Incident created for unavailable-car scenario
SS-07	Final request status / request record

Note: Actual screenshots are not embedded because they were not provided with the final-report template. The table above identifies the evidence to insert from the user's ServiceNow project.

8. ADVANTAGES & DISADVANTAGES

Advantages	Disadvantages
Centralized request process through Service Catalog.	The solution depends on correct ServiceNow configuration and workflow conditions.
Reduces manual coordination through workflow automation.	Changes to business rules or approval requirements may require configuration updates.
Provides structured manager approval and request tracking.	Performance and availability depend on the ServiceNow instance/environment.
Unavailable-car cases can be routed to incident handling.	Users require appropriate ServiceNow access/roles to perform their tasks.

9. CONCLUSION

The Car Rental Request System demonstrates how ServiceNow Service Catalog and workflows can be used to automate a structured car-rental request process. The solution captures user requirements through a catalog item, processes requests automatically, supports manager approval, handles car-availability conditions and provides an incident path for the configured unavailable-car case. The system is designed to improve consistency, visibility and efficiency of the request lifecycle.

10. FUTURE SCOPE

- Add real-time integration with a centralized car inventory/availability database.
- Add automatic car assignment and reservation after approval.
- Add email/SMS or other notification channels based on organizational requirements.
- Add richer ServiceNow dashboards and analytics for request trends and utilization.
- Add cancellation, modification and extension workflows for existing rental requests.
- Integrate external car-rental providers or fleet-management systems where required.

11. APPENDIX

Item	Project Entry
Source Code (if any)	ServiceNow configuration/scripts used by the project. Add exported update sets or relevant scripts if required.

Item	Project Entry
Dataset Link	Not applicable to the core workflow project unless an external car-inventory dataset is used.
GitHub & Project Demo Link	To be added by the project team if available.

This report follows the uploaded Final Report structure, which lists Introduction, Ideation Phase, Requirement Analysis, Project Design, Project Planning & Scheduling, Functional and Performance Testing, Results, Advantages & Disadvantages, Conclusion, Future Scope and Appendix.
